Summary of the invention

The first subject of the invention is a tube fitted with a head intended to fix capping, the second subject of the invention described below ~~and claimed in claim 10~~, and with a cylindrical or prismatic skirt having an orthogonal section of any shape (elliptical, round, polygonal, etc..) whose largest inscribed circle has a diameter D, characterized in that the head is provided with a round cylindrical wall extending towards inside the tube and surrounding an opening that is concentric to said inscribed circle, said opening - which will be hereinafter called "large-diameter- opening" for simplification - having a diameter typically lying between  $0.5*D$  and  $0.9*D$ , and in that it essentially occupies the inner volume of the skirt end over a distance that is less than D, preferably less than  $D/3$ .
